

Final Execution Plan v2.0

Treasury Alcohol Label Verification App

Project Objective

Deliver a deployed, documented, working prototype before June 15.

Primary Goal

Working software.

Secondary Goal

Strong documentation.

Tertiary Goal

Bonus features.

Tuesday, June 9

Architecture Verification & Project Setup

Objectives

- ☐ Final review of all planning documents
- ☐ Create GitHub repository
- ☐ Create final project folder structure
- ☐ Configure Python virtual environment
- ☐ Install project dependencies
- ☐ Configure Tesseract OCR
- ☐ Verify OCR works locally
- ☐ Create initial Streamlit application shell

Deliverables

- ☐ Repository created
- ☐ Folder structure complete
- ☐ Dependencies installed
- ☐ Streamlit launches successfully
- ☐ OCR environment verified

Success Criteria

No further architecture discussions required.

Project skeleton committed to GitHub.

Wednesday, June 10

Data Ingestion & OCR Foundation

Objectives

Build:

- CSV Loader
- CSV Validation
- Image Upload Module
- OCR Module
- Text Normalization Module

Deliverables

Application can:

- Upload CSV records
- Upload label images
- Extract OCR text
- Display OCR output

Success Criteria

OCR successfully reads sample labels.

CSV validation catches missing required fields.

Thursday, June 11

Record Matching Engine

Objectives

Build:

- Record Matching Engine
- Confidence Scoring
- Auto Match Logic
- Needs Review Logic
- No Match Logic

Matching Thresholds

95%+:

Auto Match

70–94%:

Needs Review

Below 70%:

No Match

Deliverables

Application can:

- Match labels to CSV records
- Display confidence scores
- Route uncertain matches to review

Success Criteria

Matching engine works against sample datasets.

Friday, June 12

Validation Engine

Objectives

Build:

- Field Extraction
- Brand Name Validation
- Class/Type Validation
- Alcohol Content Validation
- Net Contents Validation
- Government Warning Validation
- Recommendation Engine

Deliverables

Application generates:

- Pass
- Fail
- Missing
- Needs Review

with explanations.

Success Criteria

Core validation workflow functions end-to-end.

Saturday, June 13

Streamlit UI & User Workflow

Objectives

Build:

- CSV Upload Screen
- Image Upload Screen
- Batch Processing Workflow
- Results Dashboard
- OCR Text Viewer
- Error Handling
- Processing Time Display

Deliverables

Complete user workflow.

Success Criteria

User can:

- Upload CSV
- Upload images
- Run verification
- Review results

without assistance.

Sunday, June 14

Deployment, Testing & Documentation

Objectives

Deploy application to Render.

Create:

- Sample labels
- Sample CSV datasets
- Clean batch examples
- Mixed-error examples
- Poor-quality examples

Complete:

- README review
- Screenshot capture
- Deployment verification
- Documentation review

Deliverables

Publicly accessible prototype.

Success Criteria

Treasury reviewer can use the application without local setup.

Monday, June 15 (Buffer / Submission Day)

Objectives

- Final testing
- Final README verification
- Verify deployment URL
- Verify sample data
- Verify GitHub repository
- Remove dead code
- Clean comments
- Submit assessment

Deliverables

Assessment submitted.

Success Criteria

Submission completed with time remaining before deadline.

Scope Protection Rules

If behind schedule:

1. Working OCR beats image preprocessing.
 2. Working record matching beats advanced confidence algorithms.
 3. Working validation beats visual polish.
 4. Working deployment beats bonus features.
 5. Working software beats clever AI.
 6. Human-review workflow is never removed.
-

Definition of Success

The reviewer can:

- Open the public URL
- Upload a CSV file
- Upload label images
- Receive record matching results
- Receive validation results
- Understand why results were generated
- Review OCR output
- Export results
- Review sample datasets
- Read documentation
- Evaluate the prototype without assistance

If that happens, the project succeeds.

Final Reminder

This is a prototype.

The objective is not to build the perfect compliance platform.

The objective is to demonstrate that local OCR, record matching, and explainable validation can reduce repetitive compliance review work while preserving human oversight.
